

View:

A view is a virtual table

A view doesn't physically exist like regular tables

view definition is stored in data dictionary

You can query views and even modify, remove or add data using update, delete or insert statements,

provided the user has the appropriate privileges on the underlying base tables.

* views are used in application for several reasons; including the following:

- reduce complexity
- improve security
- increase convenience
- rename table columns
- customize the data for user
- protect data integrity

* You can use a view to add column level or value based security to table

--Column level security is provided by creating a view that gives access to selected columns of base tables

--value based security involves using where clause in the view definition which displays only selected rows of base tables

* need create any views system privilege required to create view

* if you want to modify the view, you can use create or replace view statement instead of dropping and re-creating the view
